1 Overview

1.1 Intel Automotive-Grade Devices

Intel automotive-grade devices are available in CPLD, FPGA, system on a chip (SoC), and Enpirion® PowerSoC's. You can use these devices for high-temperature environments, such as automotive driver assist, infotainment, and e-vehicle.

1.2 Intel Automotive Qualifications

Intel automotive-grade devices comply to the following qualifications:

- ISO-26262
- IEC-61508
- AEC-Q100
- ISO-9001
- TS-16949
- Electronic Industries Alliance (EIA)
- Joint Electron Device Engineering Council (JEDEC)

1.3 Supported Device Families

Table 1. Intel Automotive-Grade Device Families

Category	Product Family	Quartus Software Support ¹	Description
IC, FPGA	Cyclone® 10	Version 17.1 and later	Low-cost, low-power, feature-rich FPGAs
IC, FPGA	Arria® 10	Version 14.0.2 and later	High-performance, low-power 20 nm FPGAs with hard floating-point digital signal processing (DSP) blocks
IC, power	Enpirion	—	Integrated inductor, combination of small footprint, low noise performance, and high efficiency

continued...

¹ Starting from version 15.1, the Quartus II software is known as the Quartus® Prime software.

Category	Product Family	Quartus Software Support ¹	Description
IC, FPGA	MAX [®] 10	Version 14.0.2 and later	Low-cost, instant-on, small form factor programmable logic device
IC, SoC	Cyclone V SoC	Version 12.1 and later	Low-cost, low-power, user-customizable ARM-based SoC devices
IC, FPGA	Cyclone V	Version 11.1 and later	Low-cost, low-power, feature-rich 28 nm FPGAs
IC, FPGA	Cyclone IV	Version 9.1 SP2 and later	Low-cost, low-power, feature-rich 60 nm FPGAs (1.2 V)
IC, CPLD	MAX V	Version 11.0 and later	High-density, low-power glue logic CPLDs (1.8 V)
IC, CPLD	MAX II	Version 7.2 SP1 and later	High-density, low-power glue logic CPLDs (3.3 V, 2.5 V)

Volume Production Support for Legacy Device Families			
Category	Product Family	Quartus Software Support ²	Description
IC, FPGA	Cyclone III	Version 8.0 to 13.1	Low-cost, feature-rich 65 nm FPGAs
IC, FPGA	Cyclone II	Version 7.2 SP1 to 13.0	Low-cost, feature-rich 90 nm FPGAs
IC, FPGA	Cyclone	Version 7.2 SP1 to 13.0	Low-cost, glue logic 130 nm FPGAs
IC, CPLD	MAX 7000AE	Version 7.2 SP1 to 13.0	High-performance, glue logic CPLDs (5-V I/O compatible)

1 Starting from version 15.1, the Quartus II software is known as the Quartus[®] Prime software.

2 The legacy devices are only supported in the Quartus II software.

3 Quartus Prime Software Support

The Intel Quartus Prime design software supports the automotive-grade devices in the automotive temperature range. The Quartus Prime software provides a comprehensive environment for SoC design. It also includes HDL and schematic design entry, compilation and logic synthesis, full simulation and advanced timing analysis, Signal Tap II logic analyzer, and device configuration.

To target an automotive-grade device in your design in the Quartus Prime software, follow these steps:

1. Click **Assignments** ► **Device**. The **Settings** dialog box appears.
2. In the **Family** drop-down list, select your device.
3. Under **Target device**, select **Specific device selected in 'Available devices' list**.
4. In the **Available devices** list, select the appropriate ordering code.

Note: The Quartus Prime software does not show the "N" suffix, which indicates a lead-free device. For example, the 5CGXFC3B6U15A7N device is shown only as 5CGXFC3B6U15A7.

5. Click **OK**.

Legacy support for the following automotive-grade devices in Intel Quartus Prime software requires special approval. Contact the nearest Intel sales representative to submit your request.

- Cyclone III
- Cyclone II
- Cyclone
- MAX 7000AE

4 Power Analysis and Estimation

4.1 Early Power Estimator

The Early Power Estimator (EPE) is a power estimation tool that helps you estimate the power consumption of your design during the system planning phase for proper power supply planning and consideration.

The EPE allows you to enter design information based on architectural features and calculates the power consumed by each architectural feature. Inputs to the EPE are environmental conditions and device resources (such as clock frequency, RAM blocks, and digital signal processing [DSP] blocks) that you expect to use in your design. The EPE then calculates the static and dynamic power, current estimates, and thermal analysis for the design.

You can either enter the design information manually into the spreadsheet or import a power estimator file of a fully or partially completed design from the Quartus Prime software. After importing a file, you can edit some of the input parameters including V_{CCINT} , ambient temperature, airflow, clock frequency, and toggle percentage to suit your system requirements.

The value obtained from the EPE is only an estimation and should not be used as a specification. The accuracy of the EPE results depends on how close your input of the design information into the EPE resembles that of the final design.

For more information about the EPE, and how to generate and import the power estimator file, refer to the respective user guides.

4.2 Power Analyzer

The Power Analyzer tool in the Quartus Prime software is a power analysis tool that helps you calculate your design power consumption accurately to ensure thermal and power supply budgets are not violated after your design is complete. The Power Analyzer tool requires your design to be synthesized and fitted to the target device.

Availability of information such as design resources, how the design is placed and routed on the target device, and the I/O standards assigned to each I/O cell allow the Power Analyzer tool to provide accurate power estimation.

The process of using the Power Analyzer tool consists of the following three parts:

- Specifying sources of input data
- Specifying operating conditions
- Running the Power Analyzer tool

The input data consists of the signal activities data (toggle rates and static probabilities) of the compiled design. Signal activity data can be derived from simulation results, user assignment in the Assignment Editor, user-defined default toggle rate, and vectorless estimation.

The operating conditions include device power characteristic, ambient and junction temperature, cooling solution, and board thermal model, all of which can be set in the Quartus Prime software.

The Power Analyzer tool calculates the dynamic, static and I/O thermal power consumption, current consumed from voltage source, a summary of the signal activities used for analysis, and a confidence metric that reflects the overall quality of the data sources for the signal activities.

5 DC and Timing Specifications

The automotive-grade devices have the same values for the following specifications as published in the respective device datasheets :

- Absolute maximum ratings
- Recommended operating conditions
- DC electrical characteristics
- Timing specifications over the automotive temperature range

For the maximum power-up current (I_{CCINT}) required to power up an automotive-grade Cyclone device, use the value specified for the corresponding industrial-grade device.

The on-chip series termination (R_S OCT) specifications for the following automotive-grade devices are as follows:

- Automotive-grade Cyclone III, Cyclone IV, Cyclone V, and Cyclone V SoC devices—same as the corresponding industrial-grade devices
- Automotive-grade Cyclone II devices—same as the corresponding extended-temperature devices

The switching characteristics of the automotive-grade Cyclone III, Cyclone IV, Cyclone V, and Cyclone V SoC devices are the same as the devices with -8 speed grade as published in the respective device datasheets.
